1 Connection for Standard Use

■To use TEPS series, connection shown in Fig.1.1.

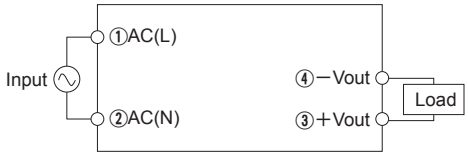

Fig.1.1 Connection for standard use

2 Wiring Input/Output Pin

■The TEPS series basically does not require an output capacitor, but the ripple voltage can be reduced by connecting an output capacitor.

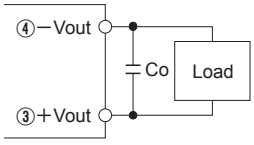

Fig.2.1 Connecting example of an external capacitor to the output side

■If output current decreases rapidly, output voltage rises transiently and the overvoltage protection circuit may operate.In this case, please Install an external capacitor Co between +Vout and -Vout pins for stable operation of the power supply.

■Connectable external capacitor on the output side is shown in Table 2.1.

Table 2.1 Connectable external capacitor on the output side

No.	Output voltage	TEPS45F/TEPS65F
1	5V	0 - 6,800μF
2	12V	0 - 4,700μF
3	24V	0 - 1,000μF

■When connect the output to FG of an equipment, a noise may become big. The noise can be reduced by connecting external filter and grounding capacitor on tha input side.

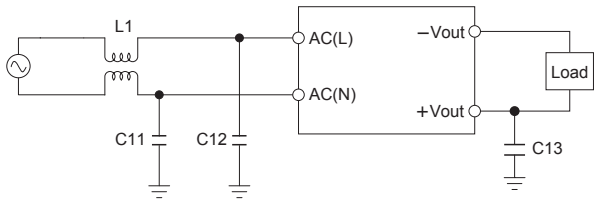

Fig.2.2 Recomemended circuit of connect output to FG

3 Function

3.1 Input voltage range

■The range is from 85VAC to 264VAC.
In cases that conform with safety standard, input voltage range is 100VAC to 240VAC (50/60Hz).
When DC input is required, Please contact us.

■If input value doesn't fall within above range, a unit may not operate in accordance with specifications and/or start hunting or fail.
If you need to apply a square waveform input voltage, which is commonly used in UPS and inverters, please contact us.

■When the input voltage changes suddenly, the output voltage accuracy might exceed the specification. Please contact us.
If the restart time of the short interruption power failure is less than 3 seconds, perform a thorough evaluation.

■A power factor improvement circuit (active filter) is not built-in. If you use multiple units for a single system, standards for input harmonic current may not be satisfied. Please contact us for details.

3.2 Inrush current limiting

■An inrush current limiting circuit is built-in.

■If you need to use a switch on the input side, please select one that can withstand an input inrush current.

■Thermistor is used in the inrush current limiting circuit. When you turn the power ON/OFF repeatedly within a short period of time, please have enough intervals so that a power supply cools down before being turned on.

3.3 Overcurrent protection

■An overcurrent protection circuit is built-in and activated over 105% of the rated current. A unit automatically recovers when a fault condition is removed.
Please do not use a unit in short circuit and/or under an overcurrent condition.

■Hiccup Operation Mode
When the output voltage drops at overcurrent, the average output current is reduced by hiccup operation of power supply.
Please contact us for details.

3.4 Overvoltage protection

■An overvoltage protection circuit is built-in. If the overvoltage protection circuit is activated, shut down the input voltage, wait more than 3 minutes and turn on the AC input again to recover the output voltage. Recovery time varies depending on such factors as input voltage value at the time of the operation.

Remarks :
Please avoid applying a voltage exceeding the rated voltage to an output terminal. Doing so may cause a power supply to malfunction or fail. If you cannot avoid doing so, for example, if you need to operate a motor, etc., please install an external diode on the output terminal to protect the unit.

3.5 Output ripple and ripple noise

■The specified ripple and ripple noise are measured by the method introduced in Fig.3.1.

■Capacitors Co and C1 should be hybrid electrolytic capacitors, ceramic capacitors, or other capacitors with good high frequency characteristics. The output ripple voltage may be affected by the ESR/ESL of the capacitor or the wiring impedance.

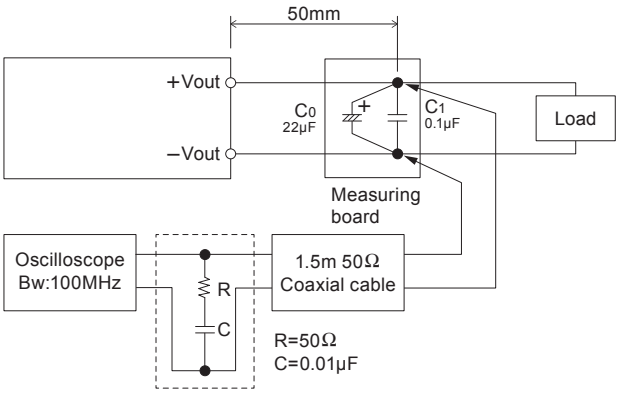

Fig.3.1 Measuring method of Ripple and Ripple Noise

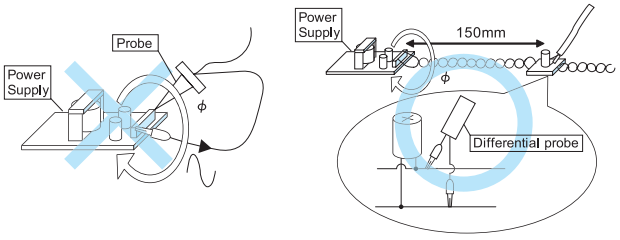
Remarks :

When GND cable of probe with flux of magnetic force from power supply are crossing, ripple and ripple noise might not measure correctly.

Please note the measuring environment.



Bad example Good example

Fig.3.2. Example of measuring output ripple and ripple noise

3.6 Isolation

■For a receiving inspection, such as Hi-Pot test, gradually increase (decrease) the voltage for the start (shut down). Avoid using Hi-Pot tester with the timer because it may generate voltage a few times higher than the applied voltage, at ON/OFF of a timer.

■When testing isolation between input and output, Short-circuit the input and output respectively.

3.7 Reducing standby power

■Burst operation at light loading, the internal switch element is intermittent operated, and the switching loss is decreased.
(standby power of AC230V input : 0.2W typ)
Burst operation can cause sound noise.

4 Series / Parallel and Redundancy Operation

4.1 Series operation

■You can use a power supply in series operation. The output current in series operation should be lower than the rated current of a power supply with the lowest rated current among power supplies that are serially connected. Please make sure that no current exceeding the rated current flows into a power supply.

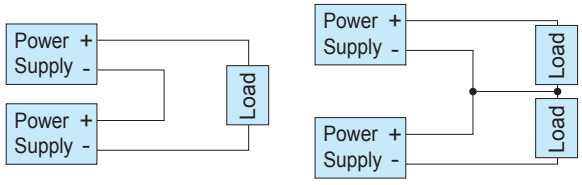


Fig.4.1 Examples of connecting in series operation

4.2 Parallel and redundancy operation

■Parallel operation is not possible.

■Redundancy operation is available by wiring as shown below.

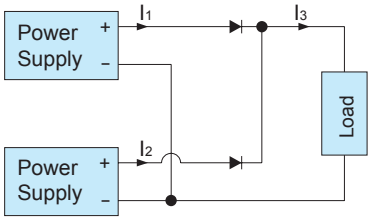

Fig.4.2 Example of redundancy operation

■Even a slight difference in output voltage can affect the balance between the values of I_1 and I_2.
Please make sure that the value of I_3 does not exceed the rated current of a power supply.

$I_3 \leqq$ the rated current value

5 Cleaning

■Cleaning agents : IPA (Solvent type)

■Cleaning period : When cleaning the unit, the unit must be washed with a brush, and IPA must be kept out of the unit.

■After cleaning, dry them enough.

6 Temperature Measurement Point

■It is necessary to note thermal fatigue life by power cycle. Please reduce the temperature fluctuation range as much as possible when the up and down of temperature are frequently generated.

■Please have sufficient ventilation to keep the temperature of point ① in Fig.6.1-6.2 at Table6.1-6.2 or below. Please also make sure that the ambient temperature does not exceed 70℃.

■The life expectancy in the upper bound temperature is two years or more.

■Please be careful of electric shock or earth leakage in case of temperature measurement, because Point ① is live potential.

■Please contact us for details.
